

# Turnover

## The call sheet stops being a PDF

A live, personalised call sheet for South African commercial production. Every person on the sheet opens one link and sees only their own day. Production sees who has actually read it, and can move the schedule without sending another attachment.

---

|                          |                   |          |                                |            |             |               |
|--------------------------|-------------------|----------|--------------------------------|------------|-------------|---------------|
| 07:00                    | 08:00             | 09:30    | 17:02                          | 20:00      | 20:45       | —             |
| Unit, catering, security | General crew call | Turnover | Setup overruns. The day moves. | Wrap snack | Camera wrap | Who was told? |

---

## 01 · WHY THIS EXISTS

# Three documents that stopped agreeing

This isn't a hypothesis. It's what one ordinary shoot day looked like — a well-run job, an experienced team, and paperwork doing exactly what paperwork does.

---

## 3

ATTACHMENTS, ONE  
EMAIL

Call sheet, shooting schedule and production booklet, sent together to roughly thirty people. Each one restates the same call times, so each one is another chance to disagree with the others.

---

## 17:37

THE NIGHT BEFORE

Sent the evening before a 07h00 unit call. Anyone asleep, driving, or out of data finds out at the gate — and there is **no way to know who has read it**. Production discovers the gap by phoning people at nine at night.

---

## 3

CONTRADICTIONS ON  
ONE DAY

Lunch appears as both **15h00** and **15h15**. The minimum temperature is given as **2°**, **3°** and **4°** in three places. A gear check is dated both the 7th and the 11th. Nobody made a mistake — one file was updated and the others weren't.

---

## 0

RECORD OF CHANGES

When the day slips, the schedule moves in a WhatsApp group that half the crew have muted. Nothing connects that message back to the sheet, and nothing survives to settle an overtime dispute three weeks later.

---

## 02 · WHAT IT IS

# One app.

## The role decides what's in it.

Not four products. One build, where the tabs, the editable rows and the visible data all change according to who production invited and what they were invited as.

## COORDINATOR

### Builds and publishes

Uploads the sheet she already makes, checks the parse, publishes. Sees who has confirmed, nudges the gaps, tracks minor hours and catering counts.

## 1st AD

### Runs the day

The only role that moves a time or wraps a shot. Changes stage as a draft and go out in one publish, so nobody reads a half-edited day.

## CREW &amp; CAST

### Read, confirm, sign out

Their own call time, their own location, their own wrap. Their department plus every head of department. Three actions: confirm, sign out, flag a problem.

## AGENCY &amp; CLIENT

### Progress only

A guest seat on one project. Sees how the day is tracking against schedule. No contact details, no cast personal data, no other jobs on the slate.

Two things sit outside the permission model on purpose. **Reporting a safety or harassment concern is available to every role including guests** — a flag with a permission gate on it is a flag that doesn't get used. And **crew can reach each other directly**, because a grip needing the gaffer should not have to go through production.

## 03 • A REAL MOMENT

# Setup overruns by twenty-five minutes

Every shoot has this moment. Here is what it costs now, and what it costs with a live sheet.

| Today                       |                                                                         | With Turnover                 |                                                                        |
|-----------------------------|-------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------|
| Paper sheet, WhatsApp group |                                                                         | One tap, staged and published |                                                                        |
| 17:02                       | AD calls the delay over comms. Half of set hears it.                    | 17:02                         | AD taps the block, adds 25 minutes. It stages as a draft.              |
| 17:09                       | PM types it into the group. 42 people who aren't affected get the ping. | 17:03                         | Publish. 34 affected people are notified. The other 42 get nothing.    |
| 17:15                       | Extras are already en route for a call that moved.                      | 17:03                         | Extras' call time updates on their own link before they leave.         |
| 17:30                       | Caterer is still cooking to the printed time.                           | 17:03                         | Wrap snack shifts. Catering count is live on the coordinator's screen. |
| 19:40                       | Three crew ask the PM individually what the new wrap is.                | Any time                      | Anyone checks their own wrap without asking anyone.                    |
| Later                       | Overtime queried. The only record is a scrolled-past message.           | Later                         | Change log shows who moved it, when, and who was told.                 |

The delay itself is unavoidable — sets overrun. What's avoidable is the **forty minutes of relay** that follows it, the people who travel to a call that already moved, and the fact that six weeks later nobody can prove what the new wrap time was. Turnover doesn't stop the day slipping. It stops the slip costing anything.

## 04 • WHO CAN CHANGE WHAT

# Five scopes, not fifty checkboxes

Deliberately small. A producer must be able to explain the whole model to a new coordinator in one sentence, or people will hand around logins and the audit trail becomes worthless.

| Can they...               | Producer | Coordinator | 1st AD | Crew & cast     | Guest |
|---------------------------|----------|-------------|--------|-----------------|-------|
| Build & publish the sheet | Yes      | Yes         | —      | —               | —     |
| Move times on the day     | Override | —           | Yes    | —               | —     |
| Mark a shot wrapped       | —        | —           | Yes    | —               | —     |
| See crew contact details  | Yes      | Yes         | Yes    | Own dept + HODs | —     |
| See rates & budget        | Yes      | Read        | —      | —               | —     |
| Confirm & sign out        | Yes      | Yes         | Yes    | Yes             | —     |
| Report a safety concern   | Yes      | Yes         | Yes    | Yes             | Yes   |
| Invite people, set roles  | Yes      | Crew only   | —      | —               | —     |

**Roles attach to a job, not a person.** A 1st AD on this commercial may be a director on the next one. Permissions are granted per project and expire when the job wraps, so a crew member's access to cast contact details ends with the shoot.

**Nothing is ever deleted.** Call times are evidence in a rate or overtime dispute. Every change keeps who, what and when — permanently, and exportable.

## 05 · WHAT I'M ASKING FOR

# Three shoot days and nothing changes for you

No new software to learn, no change to how the sheet gets made, and no cost. Send me the call sheet the way you always do, and I'll do the rest by hand.

## What I need

- Three shoot days over the next two months.
- The call sheet emailed to me the evening it's finalised, exactly as it is now.
- Permission to send crew a link alongside the usual attachments — not instead of them.
- Fifteen minutes with the coordinator and the 1st AD after each day.

## What you get

- A personalised link per person, delivered by WhatsApp.
- Live confirmation tracking — who has read it, who hasn't.
- Schedule changes pushed only to affected people.
- A minor-hours clock and a live catering count.
- A full change log for every day, yours to keep.
- No cost, no commitment, and the paper sheet stays as the fallback.

The pilot runs **alongside** the existing process, never in place of it. If the link fails, the day is unaffected — the crew have the PDF they've always had. That's the point: there is no operational risk in finding out whether this works.

## 06 · HOW IT GETS BUILT

# Ship narrow, then widen

Each phase is only started once the previous one has been used on a real shoot. Nothing here is built on a guess about what production needs.

PHASE 1  
WEEKS 1-6

## Personalised links and read receipts

I enter the sheet by hand the night before. Crew get a link, production gets a confirmation board.

- One link per person, no app install, WhatsApp delivery
- Opened / confirmed tracking and one-tap nudge
- Locations, meals, weather, contacts filtered by department

PHASE 2  
WEEKS 7-12

## The coordinator takes over

Only once crew are opening the link unprompted. The sheet gets imported instead of retyped.

- Import from the existing Excel or Word template
- Crew directory that carries across jobs and pre-fills the next one
- Draft-and-publish, roles and permissions, change log

PHASE 3  
MONTH 4+

## The live day

Built last, deliberately. A delay push is noise until people already trust the link enough to check it on set.

- Shift a block, notify only affected people
- Minor hours, meal penalties, sign-out timesheets
- Read-only agency and client view

## 07 • WHAT IT COSTS

# Priced per shoot day because that's how you budget

A monthly subscription doesn't fit a business with an eight-day month and a twenty-two-day month. This sits on the production budget as a line item, like unit or radios.

|                                                                                              |                    |
|----------------------------------------------------------------------------------------------|--------------------|
| <b>Pilot — first three shoot days</b><br>Full functionality, hands-on support, no commitment | <b>No charge</b>   |
| <b>Per shoot day</b><br>Any crew size, unlimited links, change log included                  | <b>R___ / day</b>  |
| <b>Per production</b><br>Recce, wardrobe call, prep days and shoot days as one job           | <b>R___ / job</b>  |
| <b>Annual, unlimited</b><br>For a company running more than roughly six jobs a month         | <b>R___ / year</b> |

Figures are deliberately left open. I'd rather set them against what the pilot actually saves — coordinator hours spent chasing confirmations, and the cost of one avoided late call — than guess at a number now and defend it later. I'll bring a proposed rate to the debrief after the third pilot day, with the measured numbers behind it.

**What's included at every tier:** unlimited crew and cast on a sheet, WhatsApp delivery, the full change log and its export, and support on the phone for the duration of every shoot day. **No per-seat pricing** — charging per person would push production to leave people off the sheet, which is the opposite of what this is for.

## 08 · WHERE THIS GOES NEXT

# Send me one call sheet and I'll send back thirty links

That's the entire ask. One shoot, one evening of my time, no cost and no risk to the day. If the crew don't open it, we've learned something cheaply and you've lost nothing. If they do, we talk about the next two.

**The working prototype is ready to demo now  
— fifteen minutes, on your phone, using your  
own shoot day.**
